```

As you see, this table has several columns. Column "Strain" shows which strain was used in the experiment. "Environment" shows conditions in which microorganisms were propagated. Columns "Mut_ID" and "BC_ID" give information about type of mutations and barcodes that correspond to them. Columns "H_0": "H_96" show frequently of each barcode over time.

Lets modify a table:

First, remove the column "X". We are not going to use the information contained in it. For this we are going to use function "select"

select() keeps only the variables you mention - Note: Select is an add on package of dplyr and not from R.

```
# Remove column "X" from a dataframe
exp_data <- select(exp_data, - X)</pre>
head(exp_data)

```

Lets get ready for plotting:

We are going to use ggplot2 package. Please check the syntax that is commonly used for plotting with this package. Does everything make sense?

Information from a ggplot description page:

```
ggplot(df, aes(x, y, ))
```

To make a graph, we need two give a function 2 variables (2 columns) to plot them against each other.

What variables are we going to use?

Lets rearrange our table to be able to plot the data easily. Instead on keeping information about barcode frequency in rows, we are going to create a column "Time" with time points and a column "Frequency" with corresponding barcode frequencies.

```
ggplot(data = NULL, mapping = aes(), ..., en
```

ggplot() is used to construct the initial plot object, and is almost always followed by + to add component to the plot. There are three common ways to invoke ggplot:

```
ggplot(df, aes(x, y, ))
ggplot(df)
ggplot()
```

WE HAVE TO MODIFY OUR TABLE SO THAT IN ONE COLUMN IS TIME AND THE OTHER IS FREQUENCY.

First, check how function "gather" works

Gather takes multiple columns and collapses into key-value pairs, duplicating all other columns as needed. You use gather() when you notice that you have columns that are not variables.

```
gather(data, key = "key", value = "value", ..., na.rm = FALSE, convert = FALSE, factor_key = FALSE) exp_rearranged <-gather(exp_data, Generation, Frequency, H_0:H_96) head(exp_rearranged)
```

```

                                             H 0 -3.762626
```

You might have noticed that "Generation" column contains both "H" that stands for "hours" and numbers. Lets remove "H_" part from this column.

Check the syntax of "separate" function.

Given either regular expression or a vector of character positions, separate() turns a single character column into multiple columns.

```
separate(data, col, into, sep = "[\hat{l}:alnum:]] + ", remove = TRUE, convert = FALSE, extra = "warn", fill = "warn", ...)
```

```
# Separate values in "Generation" column into 2 columns
table_for_graph<-separate(exp_rearranged,Generation,into=c("H","Time"))</pre>
```

head(table_for_graph)

```
BC_ID Mut_ID Strain Environment H Time Frequency

```
## [ reached getOption("max.print") -- omitted 14114 rows ]
```

You might have noticed that our table contains a lot of "NA" values. Go ahead and remove them with na.omit function. Don't forget to check it's syntax first!

?na omit

These generic functions are useful for dealing with NAs in e.g., data frames. na.fail returns the object if it does not contain any missing values, and signals an error otherwise. na.omit returns the object with incomplete cases removed. na.pass returns the object unchanged.

```
na.omit(object, ...)
```

```
table_cleaned <-na.omit(table_for_graph)

table_cleaned$Time <- as.numeric(table_cleaned$Time)

head(table_cleaned)</pre>
```

```

L013_plot

ggplot(table_cleaned)+geom_line(aes(x=Time,y=Frequency,group=BC_ID),alpha=.2,colour="#000033")+facet_gr

Barcode trajectories

Mutations from LO13 strain shows beneficial mutations that are positively selected for in comparison to others. This is seen through a high mutation frequency, thus suggesting selection on mutation. DivAnc strain shows nuetral selection.

Lets pick one mutation and check how it behaves in different strains

filter = Use filter() find rows/cases where conditions are true. Unlike base subsetting with [, rows where the condition evaluates to NA are dropped.

== Binary operators which allow the comparison of values in atomic vectors.

```
# I've chosen Mut_ID==34
mut34 <-filter(table_cleaned, table_cleaned$Mut_ID =="34")
mut34

Mutation_34

What can you tell looking at this plot? Why do we have 2 clusters of barcodes? -Two groups of barcodes, one on top with high frequency and the bottom with low. This may happen because the low frequency coverage may represent poor barcode, thus unreliable due to its very low ferequency.

Lets filter out barcodes with frequency > (-5) and use them for subsequent analysis.

```
mut34_f<-filter(mut34, mut34$Frequency>(-5))
mut34_f
```

                        L013
                                   SC_7.0
                                            96 -4.926074
```

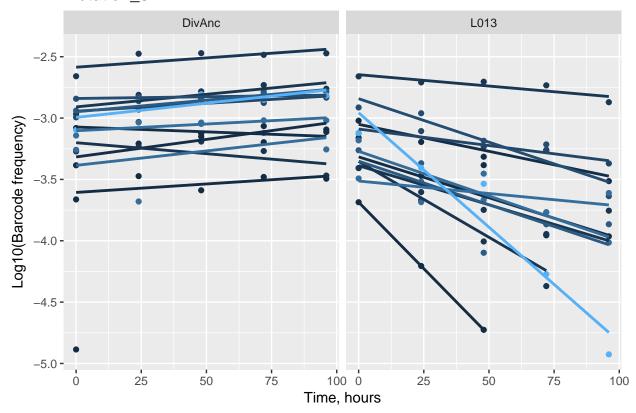

Plot

ggplot(mut34_f,aes(Time, Frequency, group=BC_ID, color=BC_ID))+geom_line()+theme(legend.position="none"

Mutation_34

Mutation 34

Now you chan choose a different mutation and check how it behaves across strains.

Now it's time to estimate slope for each barcode. Lets greate a file that will contain information about BC_ID, Mut_ID, Strain, and estimated slope.

Lets become familiar with lm function: lm is used to fit linear models. It can be used to carry out regression, single stratum analysis of variance and analysis of covariance (although aov may provide a more convenient interface for these).

For this exercise, take the filtered data for mutation 34 (mut34_f) and filter out information about one barcode you like

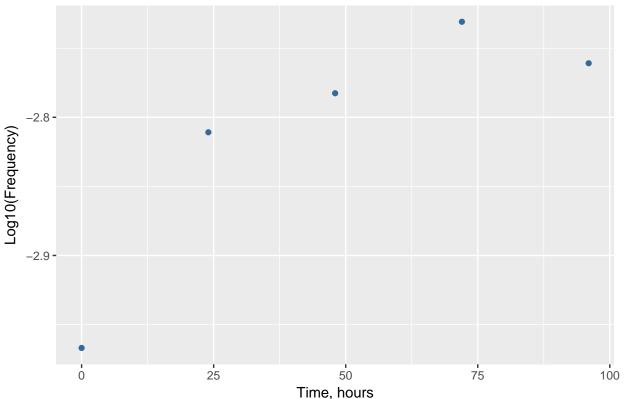

I have chosen BC_ID=25361 in DivAnc strain

```
## 3 25361 34 DivAnc SC_3.0 48 -2.782579
## 4 25361 34 DivAnc SC_3.0 72 -2.730833
## 5 25361 34 DivAnc SC_3.0 96 -2.760867
```

Lets plot frequency of this barcode:

ggplot(BC_25361,aes(Time, Frequency, colour = BC_ID))+geom_point()+theme(legend.position="none")+ggtitl

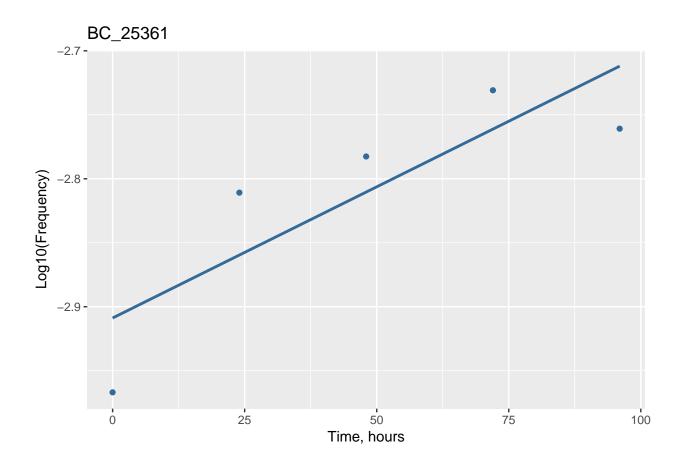

to be make it easy to ass trend line, you could name the ggplot code BC_plot and use BC_plot to add trend line. Ex. Code box #251

```
BC_plot <- ggplot(BC_25361,aes(Time, Frequency, colour = BC_ID))+geom_point()+theme(legend.position="not
```

Lets use lm function to fit the line to these points:

```
BC_plot_lm <- BC_plot + geom_smooth(se = FALSE, method = "lm")
BC_plot_lm</pre>
```

Lets check what data does lm function return:

```
Regression model = result of linear model function
regression_model<-lm(Frequency~Time,BC_25361)</pre>
summary_data<-summary(regression_model)</pre>
summary_data
##
## Call:
## lm(formula = Frequency ~ Time, data = BC_25361)
##
## Residuals:
##
## -0.05810 0.04879 0.02783 0.03036 -0.04888
##
## Coefficients:
##
                 Estimate Std. Error t value Pr(>|t|)
## (Intercept) -2.9088351 0.0443664 -65.564 7.82e-06 ***
## Time
                0.0020506 0.0007547
                                        2.717
## ---
## Signif. codes: 0 '***' 0.001 '**' 0.05 '.' 0.1 ' ' 1
##
```

```
## Residual standard error: 0.05728 on 3 degrees of freedom
## Multiple R-squared: 0.7111, Adjusted R-squared: 0.6147
## F-statistic: 7.383 on 1 and 3 DF, p-value: 0.07273
# The information we are interested in, is the value of Slope and Intercept of this line:
# Let's try to access them:
# Time
Time<-summary_data$coefficients[2]</pre>
Time
## [1] 0.002050551
# Intercept:
Intercept<-summary_data$coefficients[1]</pre>
Intercept
## [1] -2.908835
Now we can find slopes for each barcode for each mutation in all strains.
# Lets create the file:
data_header=matrix(data = NA,nrow = 1,ncol = 7)
data_header[1]="Mut_ID"
data_header[2]="BC_ID"
data_header[3]="Strain"
data_header[4]="Slope"
data_header[5] = "Intercept"
```

data_header[6]="R^2"
